Overview

This is a very small and simple app. **Just install the app** and all external URLs and attachments in the [attachment overviews](#) will open in a new browser tab.

Example

Clicking on a link leading to an external pages will open the page in a new tab, while clicking on links leading to pages inside Confluence opens them inside Confluence.

Configuration

Optionally you can define a CSS class, which will be added to every external URL and attachment link element (in attachment overviews only) in Confluence. This allows you to configure a different display style for external links in the [Confluence Stylesheet](#).

You can find External Links configuration at

> **Manage Apps > External Links for Confluence > Configure**

Confluence administration
